

Pharma-Corp procedures guidelines

Document ID: SOP-001

Title: General Facility, Compliance, and serial numbers management Management

Department: Plant Operations

1. Facility Access and Hygiene

All personnel must complete Level 2 Gowning before entering the production floor. The staff cafeteria is located in Building B and is open from 11:00 to 14:00. Safety goggles are mandatory on all lines.

2. Equipment Maintenance

Routine calibration for all conveyor belts must be performed on the first Monday of every month. Maintenance logs are stored in the main office.

3. Serialization & Supply Rules

Every individual physical unit produced requires one unique Serial Number (SN) assigned from the Central Serialization Pool. Serial Numbers are physically printed and applied to the units during the PACKAGING state.

Scrap & Replacement Rule: If a batch is scrapped *before* packaging (e.g., PLANNED or STARTED states), no Serial Numbers are consumed. However, if a batch is scrapped *after* packaging (e.g., in the STORED state), all assigned Serial Numbers are permanently burned and cannot be reused. A replacement batch must be scheduled immediately, which requires an entirely *new* allocation of Serial Numbers from the live inventory pool.

Shortage Protocol: If the live inventory pool does not have enough remaining Serial Numbers to cover the volume of the replacement batch, you must immediately halt production scheduling and request a new Serial Number block from the Global Registry.

4. ERP Batch Status Definitions

To ensure QA compliance, all batches tracked in the ERP database must adhere to these physical states:

- **PLANNED:** Production is scheduled. Physical units do not yet exist.
- **STARTED:** Active manufacturing is underway on the line.
- **PACKAGING:** Units are being sealed and labeled.
- **STORED:** Finished goods are held in the on-site warehouse facility. Batches in this state are actively subject to all drug-specific environmental and temperature SOP limits.
